

## Does recycling household rubbish make any difference to the planet?

Today our Earth is filled with a colossal amount of garbage. Lots of trash, plastic, and e-waste. We always produce it and dump it when we need a new one. Our rubbish accumulates constantly.

Recycling feels good. It gives us the power to control our habits for the benefit of our planet.

But does everyone recycle in the household? Of course not. The percentage of people thinking about our future is very small, especially in Russia. There are also advantages. The number of people involved is constantly growing.

How to start recycling garbage yourself? Zero Waste is a social movement whose base goal is to reduce the amount of waste as much as possible. This approach helps to contain the growth of landfills, reduce resource consumption. Also, reduce the amount of trash and unnecessary things in your own living space.

The Zero Waste philosophy includes five principles: Refuse, Reduce, Reuse, Recycle, Rot. Try it.

Household waste is a valuable recyclable material. It can be reintroduced and made into many different products.

A Recycling map has already been created with information about the nearest points of separate waste collection. Thus, each person can quickly see where to carry this type of rot.

Environmental disaster is a global problem, but there is a simple solution. By sorting garbage, people save their planet and ensure a clean future for themselves and their children.
