

How to get started with competitive programming

*with Codeforces:
<https://codeforces.com>

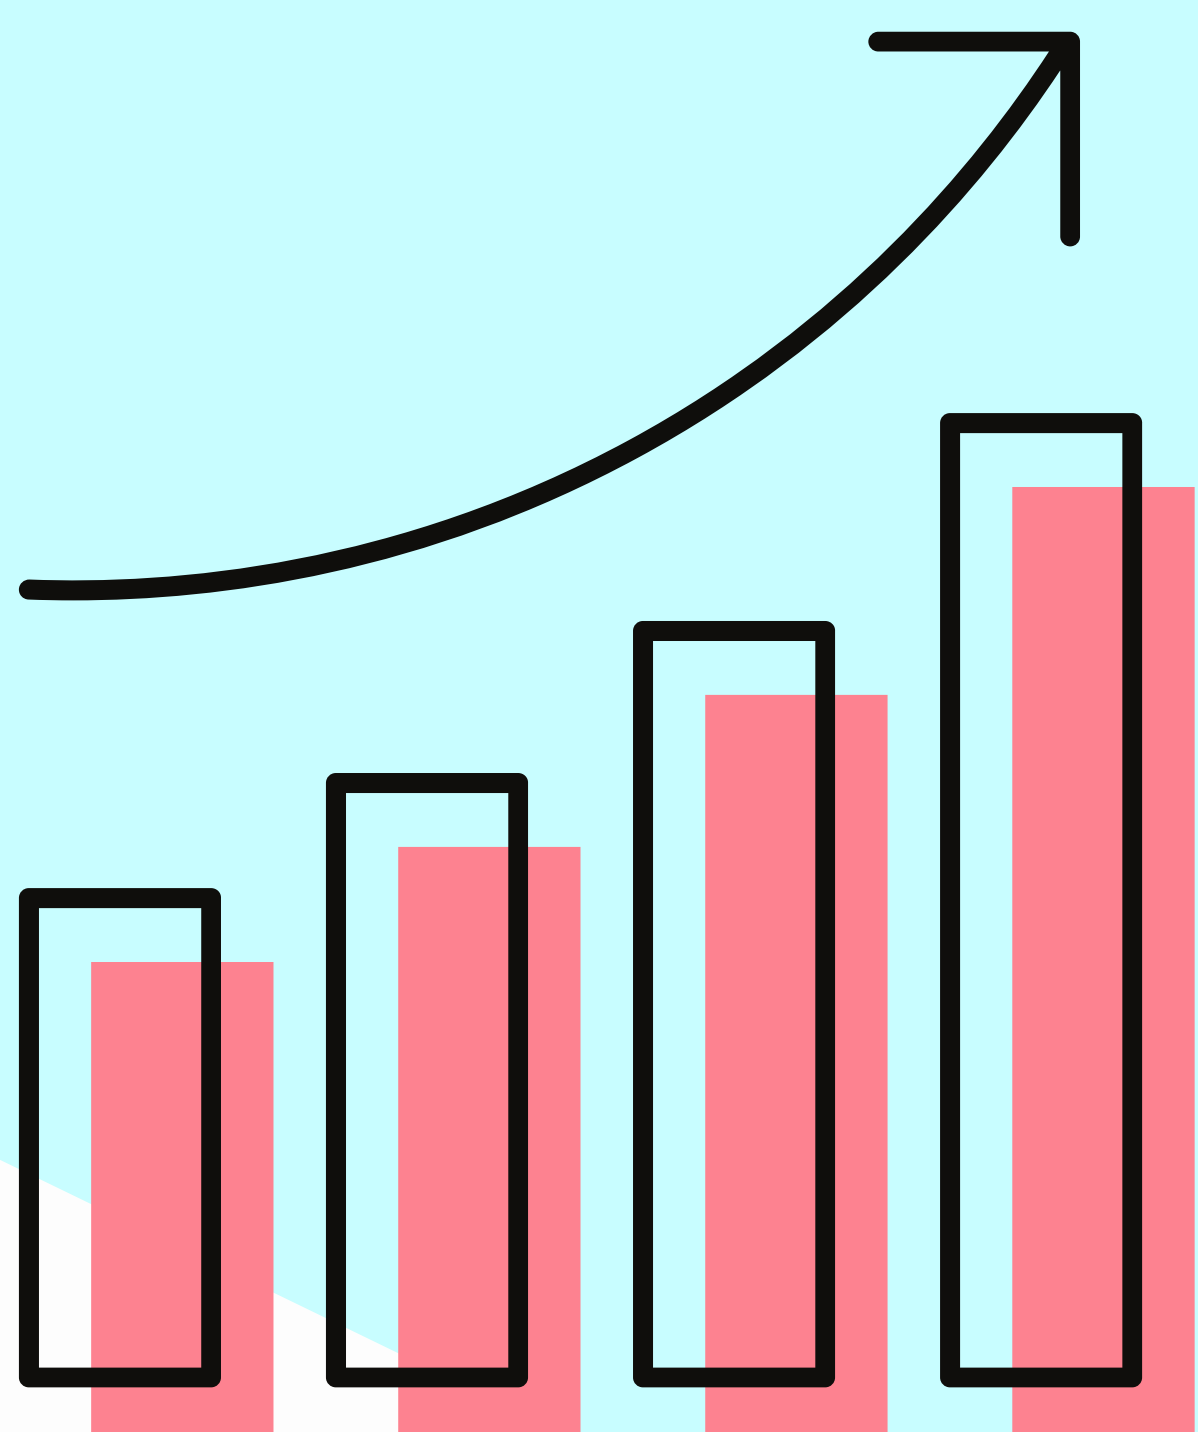

Learn programming language

I advise you to start by learning C++. It is the most preferred language for competitive programming mainly because of its STL. Providing the basic data structures and functions as templates, STL cuts down a lot of your coding time.

Solve problems

Competitive programming is a mind sport. You should regularly train, know a lot of algorithms, solve the contest. Your success depends on your position in the table, and it, in turn, depends on the number of solved problems and the speed of their completion

Stay strong and grow up

You can check your activity and results in your profile. They serve as good motivation for future growth.
